Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Estranged KNA molecules of 10-21 mucleotides than interference toward HCV in hepatitis C virus (HCV); (4) inducing targeted RNA interference toward HCV in hepatic cells; (5) inhibiting replication of HCV; (6) a vector comprising a DNA segment encoding the RNA molecule; (7) a host cell comprising the vector of (6); (8) inhibiting replication of HCV in cells carrying HCV; (9) treating hepatitis C in a subject; (10) a modified arrying HCV; (9) treating a double-stranded RNA molecule of 10-30 nucleotides in length, which mediates RNA interference toward a target agent or virus and is linked to at least one receptor-binding ligand; and colloube have antiinflammatory, hepatotropic and virucide activities. The modified RNA molecules are useful for inactivating virus in mammalian cells. The siRNAs are useful for treating hepatitis C virus, hepatitis D virus, hepatitis E virus, Ebbla virus, inammalian virus, rotavirus, recovirus, retrovirus, poliovirus, human papilloma virus, metapneumoniavirus or coronavirus infections. The methods of the invention can be used to correct or compensate for cellular physiological abnormalities involved in conferring succeptibility to viral infections in patients. The present sequence represents the SARS coronavirus nucleotide sequence,

The invention relates to inhibiting expression of a target gene (I) in  $\epsilon$  cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded

Claim 10; Page 176; 203pp; German.

```
The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (GaRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (15, 82) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAi). The method is particularly used to treat tumours or infections, especially by plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the distility (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary
structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into bathogenic for humans effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting expression of target genes, e.g. oncogenes, in cells, by introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene alleast one oligoribonucleotide (dsRNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes; developmental or prion genes, or spense expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with

The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a singlestranded segment of 1-4 mt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. plasmodium or virusesy/rioxids, pathogenic on humans, animals or plants) or against cytokine, Id, developmental or prion genes the method provides more effective inhibition of gene expression than use
                                                                                                                                                   Human, HIV; HCV; gene expression; oligoribonucleotide; tumour; pathogen; Plasmodium; virus; viroid; cytokine; prion; antisense oligonucleotide; cytostatic; virucide; protozoacide; antibacterial; ds.

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (dsRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (S1, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours or infections, especially by lasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with
                                                                                                                                                                                                                                                                                                Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary to the target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting expression of target genes, e.g. oncogenes, in cells, by introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligoribonucleotide; interferon; oncogene; cytokine; Id; developmental;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to inhibiting expression of a target gene (1) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (1) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytckine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into both in viro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Double stranded RNA; dsRNA; RNAi; RNA inhibition; cytostatic; virucide; protozoacide; gene expression; antisense; tumour; infection; Plasmodium; virus; viroid; anti-GFP; human; HIV; human immunodeficiency virus; Hepatitis C virus; human papilloma virus; gene; ds.

                                                                                                                                                                                   least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, developmental or prion genes, or genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants) Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability, ABX09936-ABX1077 represent
                                                                                                     target gene by introducing into the cell that contains the target gen
least one oligoribonucleotide (dsRNAI) that has a double-stranded (ds
structure of not more than 49 consecutive nucleotides (nt), where at
                                                                              This invention describes a novel method for inhibiting expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fragments used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1818 BP; 310 A; 649 C; 571 G; 288 T; 0 U; 0 Other;

Rost S, Hadwiger P; Kreutzer R, Limmer S, WPI; 2002-270454/32. Inhibiting gene expression in cells, useful for e.g. treating tumors, by introducing double-stranded complementary oligoRNA having unpaired

Claim 13; Page 53-54; 104pp; German.

terminal bases.

The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours

```
This sequence represents the human matrix metalloprotease (MT4-MMP 2) nuclectide sequence. The invention relates to a mammalian transmembrane muclectide sequence. The invention relates to a mammalian transmembrane muclectide, its variants and the DNA sequences encoding them. Also included in the invention is a vector comprising the MMP DNA molecules, and cells transformed using the vector. The protein, DNA and antibodies directed against the polypeptide are useful in screening inhibitors and activators for use in treating are useful in screening inhibitors and activators for use in treating archivosis deformans, chronic rheumatoid arthritis, asthma, autoimmune diseases, atrophic dermatitis, psoriasis, contact dermatitis, hair loss, ischaemic diseases, immune reaction accompanying organ transplant, hepatitis, nephritis, pancreatitis, arteriosclerosis, leukaemia, malignant tumours, wounds, corneal ulcers, tissue damage or inflammation accompanying elekcoytic infiltration, together with brain disorders during cerebral apoplexia, Alzheimer's disease, dementia, multiple sclerosis, Parkinson's disease or brain
                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matrix metalloproteame; MT4-MMP; treatment; arthrosis deformans; chronic rheumatoid arthritis; asthma; autoimmune disease; hepatitis; atrophic dermatitis; paoriasis; contact dermatitis; hair loss; nephritis; ischaemic disease; pancreatitis, arteriosclerosis; leukaemia; tumour; wound; corneal ulcer; tissue damage; inflammation; cerebral apoplexia; Alzheimer's disease; dementia; multiple sclerosis; Parkinson's disease;
but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Physiologically-active transmembrane matrix metalloprotease polypeptide, useful in screening inhibitors and activators for treating e.g. arthrosis deformans, asthma and cancers.
                                                                                                                                                                                                                                            Gaps

                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antibodies against the novel murine and human transmembrane matrix metalloproceases MT4-MMP(2) (AAY90502 and AAY90503) and MT5-MMP (AAY90504 and AAY90505). The antibodies are useful for the diagnosis and screening of inhibitors and activators useful for treating or preventing a wide variety of medical conditions, such as arthrosis deformans, rheumatoid arthritis, asthma, autoimmune diseases and atopic diagnose and screen therapeutic or prophylactic agents for conditions affecting the brain, such as cerebral stroke and Alzheimer's disease. The antibodies of the invention may also be used for the prevention, and agnosis and treatment of psoriasis, contact dermatitis, hair loss, ischaemic diseases, immune reaction accompanying organ transplant, hairlish, pancreatitis, arteriosclerosis, leukaemia, malignant tumours, wounds, corneal ulcers, tissue damage or inflammation accompanying leukocytic infiltration, dementia, multiple sclerosis, Parkinson's disease or brain tumour. The present sequence represents a exemplification of the human MT4-MMP(2) gene used as a probe in an exemplification of the invention to screen a murine conn a purpose or prain to screen a murine conn a transplant or accompanying the invention to screen a murine conn accident.
                                                                                                                                           ö
    tumours. The DNA can also be incorporated into a suitable vector for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody immunospecific for transmembrane matrix metalloprotease polypeptide, useful in screening of inhibitors and activators as drugs for, and for diagnosis of e.g. arthrosis deformans and asthma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibits the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PDGF), fibroblast growth factor (FGP), connective tissue derived growth factor (CTGP), connective tissue derived growth factor (GTGF), epidermal growth factor (KGF), vascular endothelial growth factor (WGF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of uncokinase-type plasminospen activator (UPA) and matrix metalloproteinase (MMP). The composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition for the treatment of damaged tissue i.e. chronic wounds and dermal ulcers comprises an inhibitor agent i.e. a protease and a growth

The method is useful for determining whether a patient will respond to treatment with a FTI such as (B)-6-[amino(4-chlorophenyl)(1-methyl-1H-imidazol-5-yl)methyl-4-(3-chlorophenyl):1-methyl-2-(H)quinolinone, monitoring the therapy of a patient, treating a patient with Houkemia with FTI if the analysis indicates that the patient will respond. This sequence corresponds to a gene whose expression may be
The present sequence encodes a human MMP-17, and is used to produce the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining whether a patient will respond to treatment with a farnesyl transferase inhibitor, by analyzing the expression of gene that is differentially modulated in the presence of the inhibitor.
                                                                                                                                                                                                                                                                                       Farnesyl transferase inhibitor modulated leukemia associated gene #51.

human transmembrane matrix metalloprotease MT4-MMP(2).

(first entry)

```
This sequence represents cDNA encoding a novel human transmembrane matrix metalloprotease MT4-MMP(2). MT4-MMP(2) has physiological activity different to that of MT4-MMP(2) the invention relates to antibodies against both murine and human MT4-MMP(2) the invention relates to antibodies against both murine and human MT4-MMP(2) for and AAY90503) and to antibodies against a novel murine and human transmembrane matrix metalloprotease MT5-MMP (AAY90504 and AAY90505). The antibodies are useful for the diagnosis and screening of inhibitors and activators of useful for treating or preventing a wide variety of medical conditions, continued a reflecting the anti-MT5-MMP antibodies may additionally be used to diagnose and screen therapeutic or prophylactic additionally be used to diagnose and screen therapeutic or prophylactic agents for conditions affecting the brain, such as cerebral stroke and Alzheimer's disease. The antibodies of the invention may also be used for the prevention, diagnosis and treatment of psoriasis, contact dermatitis, hair loss, ischaemic diseases, immune reaction accompanying organ transplant, hepatitis, nephritis, pancreatis, arteriosclerosis, inflammation accompanying lenkocytic infiltration, dementia, multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
Antibody immunospecific for transmembrane matrix metalloprotease polypeptide, useful in screening of inhibitors and activators as drugs for, and for diagnosis of e.g. arthrosis deformans and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to a monoclonal antibody which binds specifically to the MT4-MMP (membrane type-matrix metalloproteinase) scatalytic domain. The antibody is applicable in diagnosis and remedies for MT4-MMP participated diseases e.g. inflammations and cancer particularly rheumatoid arthritis. The present sequence is a human coding sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                       MT4-MMP; catalytic domain; antibody; inflammation; cancer; gene; membrane type-matrix metalloproteinase; antiinflammatory; antirheumatoid; antiarthritic; rheumatoid arthritis; cytostatic; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Monoclonal antibody specifically binding to natural or solubilized MT4-MMP, applicable in diagnosis and remedies for MT4-MMP participated diseases e.g. inflammations and cancer particularly rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Sequence 1, Application US/09810671

Patent No. 6455291

GENERAL INFORMATION:

ACID MOLECULES ENCODING HUMAN KINASE PROTEINS, NUCLEIC

TITLE OF INVENTION: 1SOLATED HUMAN KINASE PROTEINS, AND USES

TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: THEREOF

CURRENT APPLICATION NUMBER: US/09/810,671

CURRENT APPLICATION NOWER: 2001-06-08

NUMBER OF SEQ ID NOS: 5

SOFTWARE: FASESEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 745., Application US/09313294A

Patent No. 6476212

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

Sequence 3, Application US/10109854

Patent No. 6630371

GENERAL INFORMATION: 66303371

APPLICANT: YAN, Chunhua et al.

TITLE OF INVENTION: 1SOLATED HUMAN KINASE PROTEINS, NUCLEIC

TITLE OF INVENTION: 1SOLATED HUMAN KINASE PROTEINS, AND USES

TITLE OF INVENTION: THRREOF

TITLE OF INVENTION: THRREOF

FILE REFERENCE: CLOO0758DIV

CURRENT FAPLICATION NUMBER: 08/10/109,854

CURRENT FILING DATE: 2002-04-01

PRIOR FILING DATE: 2000-08-24

PRIOR FILING DATE: 2000-08-24

PRIOR FILING DATE: 2001-03-19

NUMBER OF SEQ ID NOS: 5

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 3

LENGTH: 21234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3, Application US/10339656

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 17063, Application US/09949016

Sequence 17063, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
CURRENT APPLICATION NUMBER: US/09/949,016

PRIOR FILING DATE: 2000-10-20
PRIOR PILING DATE: 2000-10-03
PRIOR PILING DATE: 2000-10-03
PRIOR PILING DATE: 2000-09-08
NUMBER OF SEC ID NOS: 207012
SOFTHARE: FREESEQ FOR WINDOWS VETRION 4.0
SEQ ID NO 17063
LENGTH: 100837
JULIANT: VENTER, J. Craig et al.

JITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEAGE, METHODS OF DETECTION AND USES THEREOF

Sequence 1547, Application US/09949016

Sequence 1547, Application US/09949016

Patent NO. 681239

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

ITTLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REFERENCE: CLOOR 1307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT PELLING DATE: 2000-04-14

PRIOR PELLING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: FASLESQ for Windows Version 4.0

SEQ ID NO 15947

LENGTHEN DATE: DA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GENERAL INCORPATION:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 16,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 15,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 7,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New RNase resistant small interfering RNA, useful for treating viral infections, e.g., hepatitis C, influenza virus or coronavirus infection.

Example 10; Fig 3; 74pp; English.

The present invention describes a small interfering RNA (siRNA) which comprises a modified ribonucleotide, where the siRNA is resistant to RNase and retains the ability to inhibit viral replication. Also described: (1) inactivating a virus in a parient; (2) making a modified siRNA that targets a nucleic acid sequence in a virus; (3) a double-
